In this book a multitude of Diophantine equations and their partial or complete solutions are presented. How should we solve, for example, the equation  $\eta(\pi(x)) = \pi(\eta(x))$ , where  $\eta$  is the Smarandache function and  $\pi$  is Riemann function of counting the number of primes up to  $x$ , in the set of natural numbers? If an analytical method is not available, an idea would be to recall the empirical search for solutions. We establish a domain of searching for the solutions and then we check all possible situations, and of course we retain among them only those solutions that verify our equation. In other words, we say that the equation does not have solutions in the search domain, or the equation has  $n$  solutions in this domain. This mode of solving is called partial resolution. Partially solving a Diophantine equation may be a good start for a complete solving of the problem. The authors have identified 62 Diophantine equations that impose such approach and they partially solved them. For an efficient resolution it was necessarily that they have constructed many useful "tools" for partially solving the Diophantine equations into a reasonable time. The computer programs as tools were written in Mathcad, because this is a good mathematical software where many mathematical functions are implemented. Transposing the programs into another computer language is facile, and such algorithms can be turned to account on other calculation systems with various processors. **Advances in Carbohydrate Chemistry** Resource added for the Psychology (includes Sociology) 108091 courses. A thorough history. Lactic acid's chemistry has posed problems that required the large-scale preparation of the acid for study; its manufacture is a complicated process involving many subdisciplines of the science of chemistry; its use encompasses many fields of industrial activity and important asp **Spectroscopy and Photochemistry of Uranyl Compounds** is a guide to the research and physics of the actinide elements, particularly the uranyl ion. The book is introduced with the subject of the spectroscopy of uranyl salts in the solid state. Studies dealing with the fluorescence and absorption spectra of solid uranyl salts through band measurements and empirical classification, term analysis, and fluorescence spectrum in relation to excitation by light of various wavelengths are then discussed. The book also mentions the analysis of the uranyl spectrum by Dieke and co-workers, because of the precise measurements of the fluorescence and absorption bands obtained under the Manhattan project. The table determined by Pant and Sakhwalkar in their study of the florescence spectrum of solid, hydrated uranyl fluoride at -185 degrees centigrade is presented. The text also discusses the theory of electronic structure and spectra of the uranyl ion. The spectroscopy of uranyl compounds in solution and the uranyl fluorescence intensity and decay are then presented. The book then explains the process of measuring the intensity of slowly decaying florescence of uranyl salts. The primary photochemical reactions in uranyl compounds are found to be slow, giving rise to many secondary thermal reactions that may be unwanted. Researchers in the fields of chemistry and physics working on actinide elements will find this collection of monographs invaluable. Over 300 sequences and many unsolved problems and conjectures related to them are presented herein. These notions, definitions, unsolved problems, questions, theorems corollaries, formulae, conjectures, examples, mathematical criteria, etc. on integer sequences, numbers, quotients,

residues, exponents, sieves, pseudo-primes squares cubes factorials, almost primes, mobile periodicals, functions, tables, prime square factorial bases, generalized factorials, generalized palindromes, so on, have been extracted from the Archives of American Mathematics (University of Texas at Austin) and Arizona State University (Tempe): "The Florentin Smarandache papers" special collections, and Arhivele Statului (Filiala Vâlcea & Filiala Dolj, Romania). This book was born from the collaboration of the two authors, which started in 2013. The first common work was the volume "Solving Diophantine Equations", published in 2014. The contribution of the authors can be summarized as follows: Florentin Smarandache came with his extraordinary ability to propose new areas of study in number theory, and Octavian Cira - with his algorithmic thinking and knowledge of Mathcad. "Titles of chemical papers in British and foreign journals" included in Quarterly journal, v. 1-12. At the 6th International Conference on Plant Growth Substances, held in Carleton University, Ottawa in 1968, it was decided that the 7th should be held in Czecho slovakia, following an invitation by Dr. Kutacek. Historical events intervened and in 1969 another venue was sought. An offer from the Academy of Science in Canberra was accepted by the steering committee. This left rather less time than is desirable to organize an international meeting of this nature and it was with surprise and great relief that the Organizing Committee in Canberra welcomed the arrival of 183 delegates, including a relatively large overseas contingent, to the meeting in December, 1970. The aim of these Conferences is, of course, to provide a forum for discussion of new work and recent trends, both in the lecture sessions and in conversation. Although many of those who initiated these meetings (e.g. Skoog, Went, Blackman, Bennet-Clark) were absent from the Canberra conference - some have retired -it was good to see present so many of the new generation of research workers in this field. Proceedings of the Society are included in v. 1-59, 1879-1937. Includes list of members, 1882-1902 and proceedings of the annual meetings and various supplements. The history of continued fractions is certainly one of the longest among those of mathematical concepts, since it begins with Euclid's algorithm for the great est common divisor at least three centuries B.C. As it is often the case and like Monsieur Jourdain in Moliere's "Ie bourgeois gentilhomme" (who was speak ing in prose though he did not know he was doing so), continued fractions were used for many centuries before their real discovery. The history of continued fractions and Pade approximants is also quite im portant, since they played a leading role in the development of some branches of mathematics. For example, they were the basis for the proof of the tran scendence of 11' in 1882, an open problem for more than two thousand years, and also for our modern spectral theory of operators. Actually they still are of great interest in many fields of pure and applied mathematics and in numerical analysis, where they provide computer approximations to special functions and are connected to some convergence acceleration methods. Con tinued fractions are also used in number theory, computer science, automata, electronics, etc ... Written by a distinguished University of Chicago professor, this 2nd volume in the series History of the Theory of Numbers presents material related to Diophantine Analysis. 1919 edition. Containing the transactions of the various sections, together with abstracts of papers published in other journals, etc. Vols. 3-140 include the society's Proceedings, 1907-41 Do our expectancies about ourselves and about others have any effect on our actual experiences? Over fifty years of research studies suggest not only that this is the case, but also that our expectancies can shape other people's experience in different contexts. In some cases they can help, but other times they can do harm instead. Interpersonal and Intrapersonal Expectancies provides a theory, a research review, and a summary of the current knowledge on intra- and interpersonal expectancy effects and related phenomena. Based on extensive study, and written by eminent experts from some of the world's leading academic institutions, the book presents the most recent knowledge on social and psychological mechanisms of forming both intra- and interpersonal expectancies. It also considers how expectancies are sustained and what their consequences are, as well as discussing the latest theoretical concepts and the most up-to-date research on expectancy effects. This book represents the first review of the phenomenon of interpersonal expectancies in over 20 years, and the only publication presenting a complementary view of both intra- and interpersonal expectancies. It aims to open up a discussion between researchers and theoreticians from both perspectives, and to promote an integrative approach that incorporates both.
