The Physiological Basis of Metabolic Bone Disease Mar 17 2022 Research into metabolic bone disease has made remarkable progress over the last 20 years, with the identification of numerous new molecules and pathways regulating bone cells as well as their plasma milieu. Their activities are largely regulated by the physiological status of the body incorporating the biochemical, physical and mechanical functions of bone, kidney and intestinal tissues. The Physiological Basis of Metabolic Bone Disease integrates the knowledge derived from molecular techniques with the fundamental principles of the physiology of these organs. The book places particular emphasis on bone cell activities and the regulation of plasma calcium, phosphate homeostasis, and whole body nutrition. It reviews the nutritional requirements for calcium and vitamin D for the prevention of osteoporosis. It covers vitamin D, calcium and phosphate absorption; calcium sensing receptors; the role of parathyroid hormone; physiological actions of calcitonin; and the diagnosis and significance of osteoporosis.

Reviewing the physiological significance of advances in the molecular biology of metabolic bone disease, this book provides a valuable reference for researchers as well as practicing clinicians.

Neurobiology of Monotremes Jan 03 2021 Neurobiology of Monotremes brings together current information on the development, structure, function and behavioural ecology of the monotremes. The monotremes are an unusual and evolutionarily important group of mammals showing striking behavioural and physiological adaptations to their niches. They are the only mammals exhibiting electroreception (in the trigeminal sensory pathways) and the echidna shows distinctive olfactory specialisations. The authors aim to close the current gap in knowledge between the genes and developmental biology of monotremes on the one hand, and the adult structure, function and ecology of monotremes on the other. They explore how the sequence 'embryonic structure > adult structure > behaviour' is achieved in monotremes and how this differs from other mammals. The work also combines a detailed review of the neurobiology of monotremes with photographic and diagrammatic atlases of the sectioned adult brains and peripheral nervous system of the short-beaked echidna and platypus. Pairing of a detailed review of the field with the first published brain atlases of two of the three living monotremes will allow the reader to immediately relate key points in the text to features in the atlases and will extend a universal system of brain nomenclature developed in eutherian brain atlases by G Paxinos and colleagues to monotremes.
